# Hook-driven dev workflows with Claude Code

2 min read · 1 day ago

AI works best for me when it takes care of the workflow itself and allows me to focus on the business goals and architecture. I don't want to be constantly prompting and guiding the agent to do the right thing, to run code reviews etc. It's not enjoyable and it's boring.

I've had a lot of success introducing deterministic workflows on repositories I fully control. I own the lint rules, the git hooks, the code review steps, and I can bake those into the process. I am consistently getting good results.

However, I am not getting good results when I need to work in legacy codebases, or codebases where I do not control all of those parameters. How can I get Claude to apply the same workflow and coding standards in those situations?

The solution I've arrived at is Claude Code hooks. I realised that they can do a lot more than I understood. They allow a highly enforced workflow with strong guardrails, written in a proper programming language, with 100% test coverage.

In the full post I walk through the architecture of a hook-driven workflow engine, show the state machine that enforces transitions between planning, developing, reviewing, and committing phases, and share code examples from a working GitHub repo with full test coverage.

### Reverse Engineering your Software Architecture with Claude Code to help Claude Code

Coding agents can do more when they understand your system.

```
TRUCTION: Use the Task tool with subagent_type "automatic-code-reviewer". Pass only th
e list as the prompt. The agent will follow its configured review procedure. SHOW ALL
DINGS TO THE USER.

omatic-code-review:automatic-code-reviewer(Review modified code)
Done (19 tool uses · 18.0k tokens · 52s)

e Review Findings

 automatic code reviewer found 3 violations related to domain modeling:

lations Found

[DOMAIN MODELING] - CodeLinkMenu.tsx:6
 Issue: filePath is a bare string primitive representing a domain concept. Should use
nded type like FilePath to enforce type safety.
 Fix: Create a branded type type FilePath = string & { readonly __brand: 'FilePath' }
ate the parameter to filePath: FilePath
```

## Auto-Reviewing Claude's Code

A well-crafted system prompt will increase the quality of code produced by your coding assistant. But it's not enough for quality code.
